ANNUAL AMBIENT MONITORING REPORT FOR PETROLEUM REFINING – INDUSTRY STANDARD

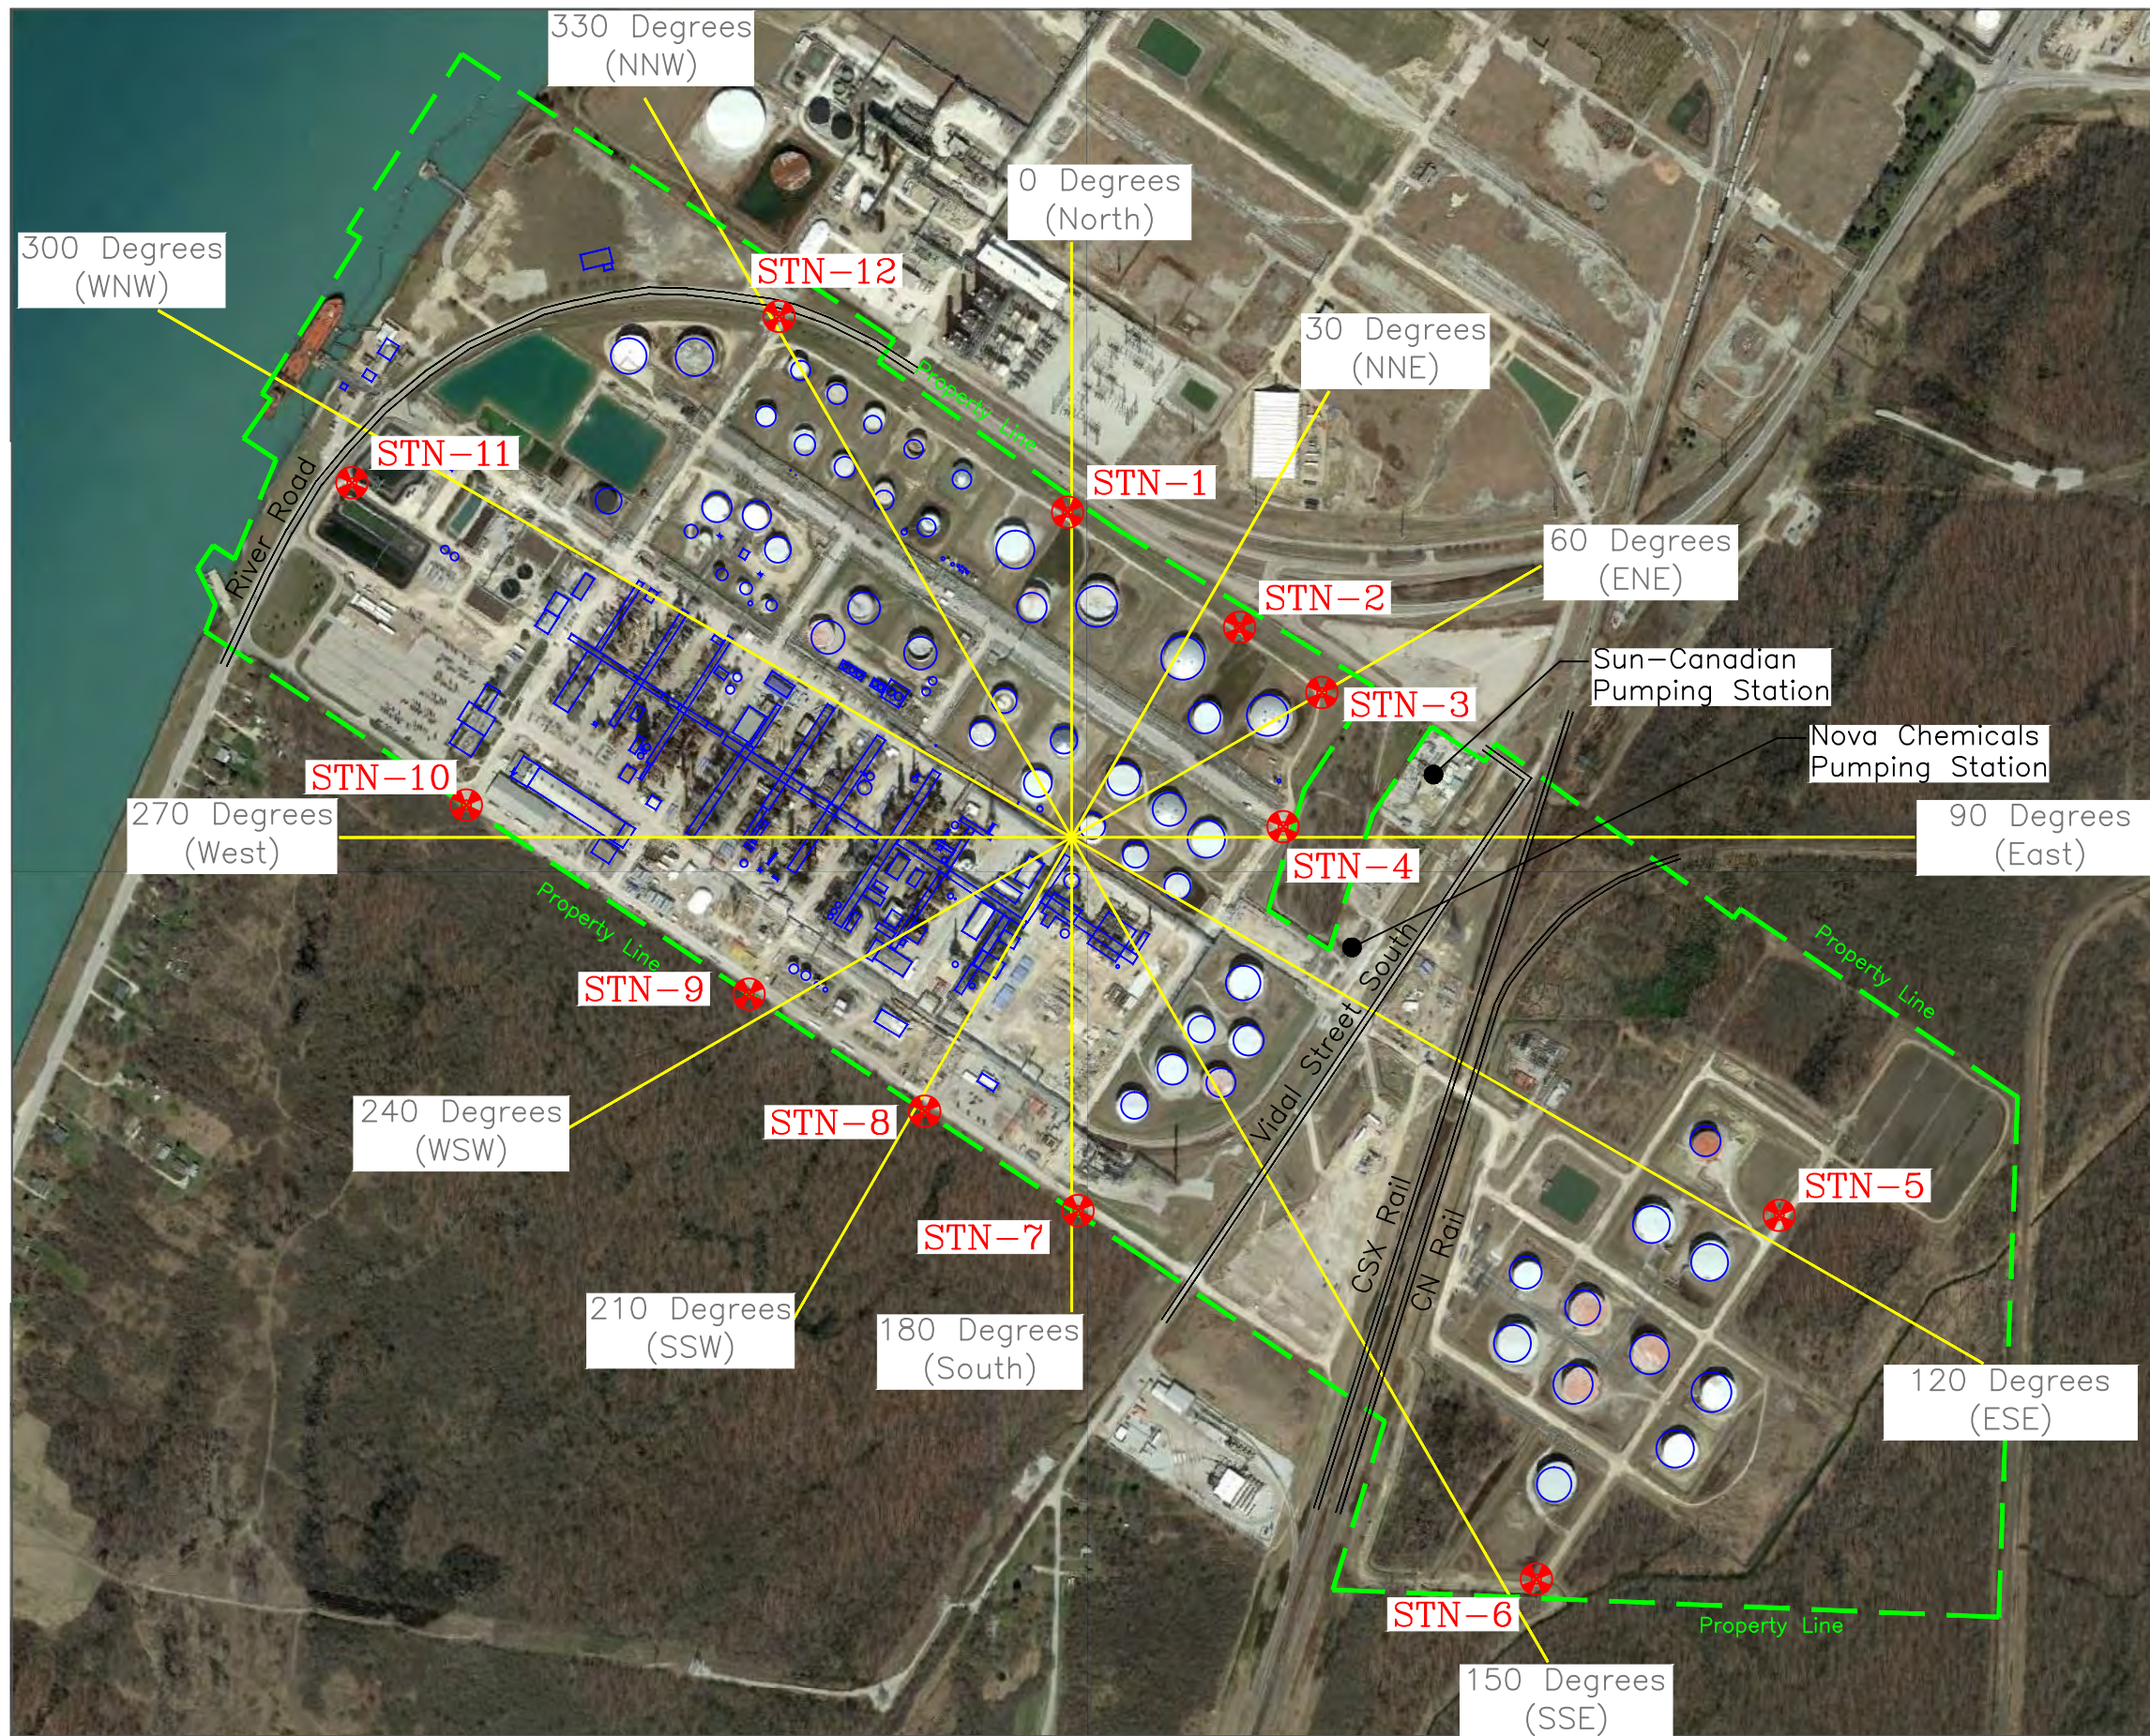

The air monitoring program assesses annual benzene concentrations along the Suncor refinery's perimeter using passive diffusive monitoring technology which has been approved by the MECP. Samples are taken continuously over a two-week period and the results are posted within 60 days of sample collection on our Suncor Sarnia Refinery website.

Following three full calendar years (2018-2020) of monitoring, a three-year benzene measurement baseline will be determined for each monitoring location. The baseline will then be updated annually based on the measurements from the previous three calendar years. Following the fourth year of monitoring (2021), a statistical comparison to the baseline will be performed for each monitor based on measurements from the previous calendar year. If there is any location with a statistically significant increase from the baseline, further analysis will be conducted to assess for potential actions to prevent, minimize or reduce the risk of future statistically significant increases in annual benzene concentrations.

In 2018 our annual average from all 12 perimeter monitoring locations was 1.72 ug/m³. As indicated above, the statistical analysis with our three year benzene measurement baseline will be included in the 2020 annual report. The full results from the 2018 monitoring program can be found below and the map of the property line monitoring locations can be found in the appendix.

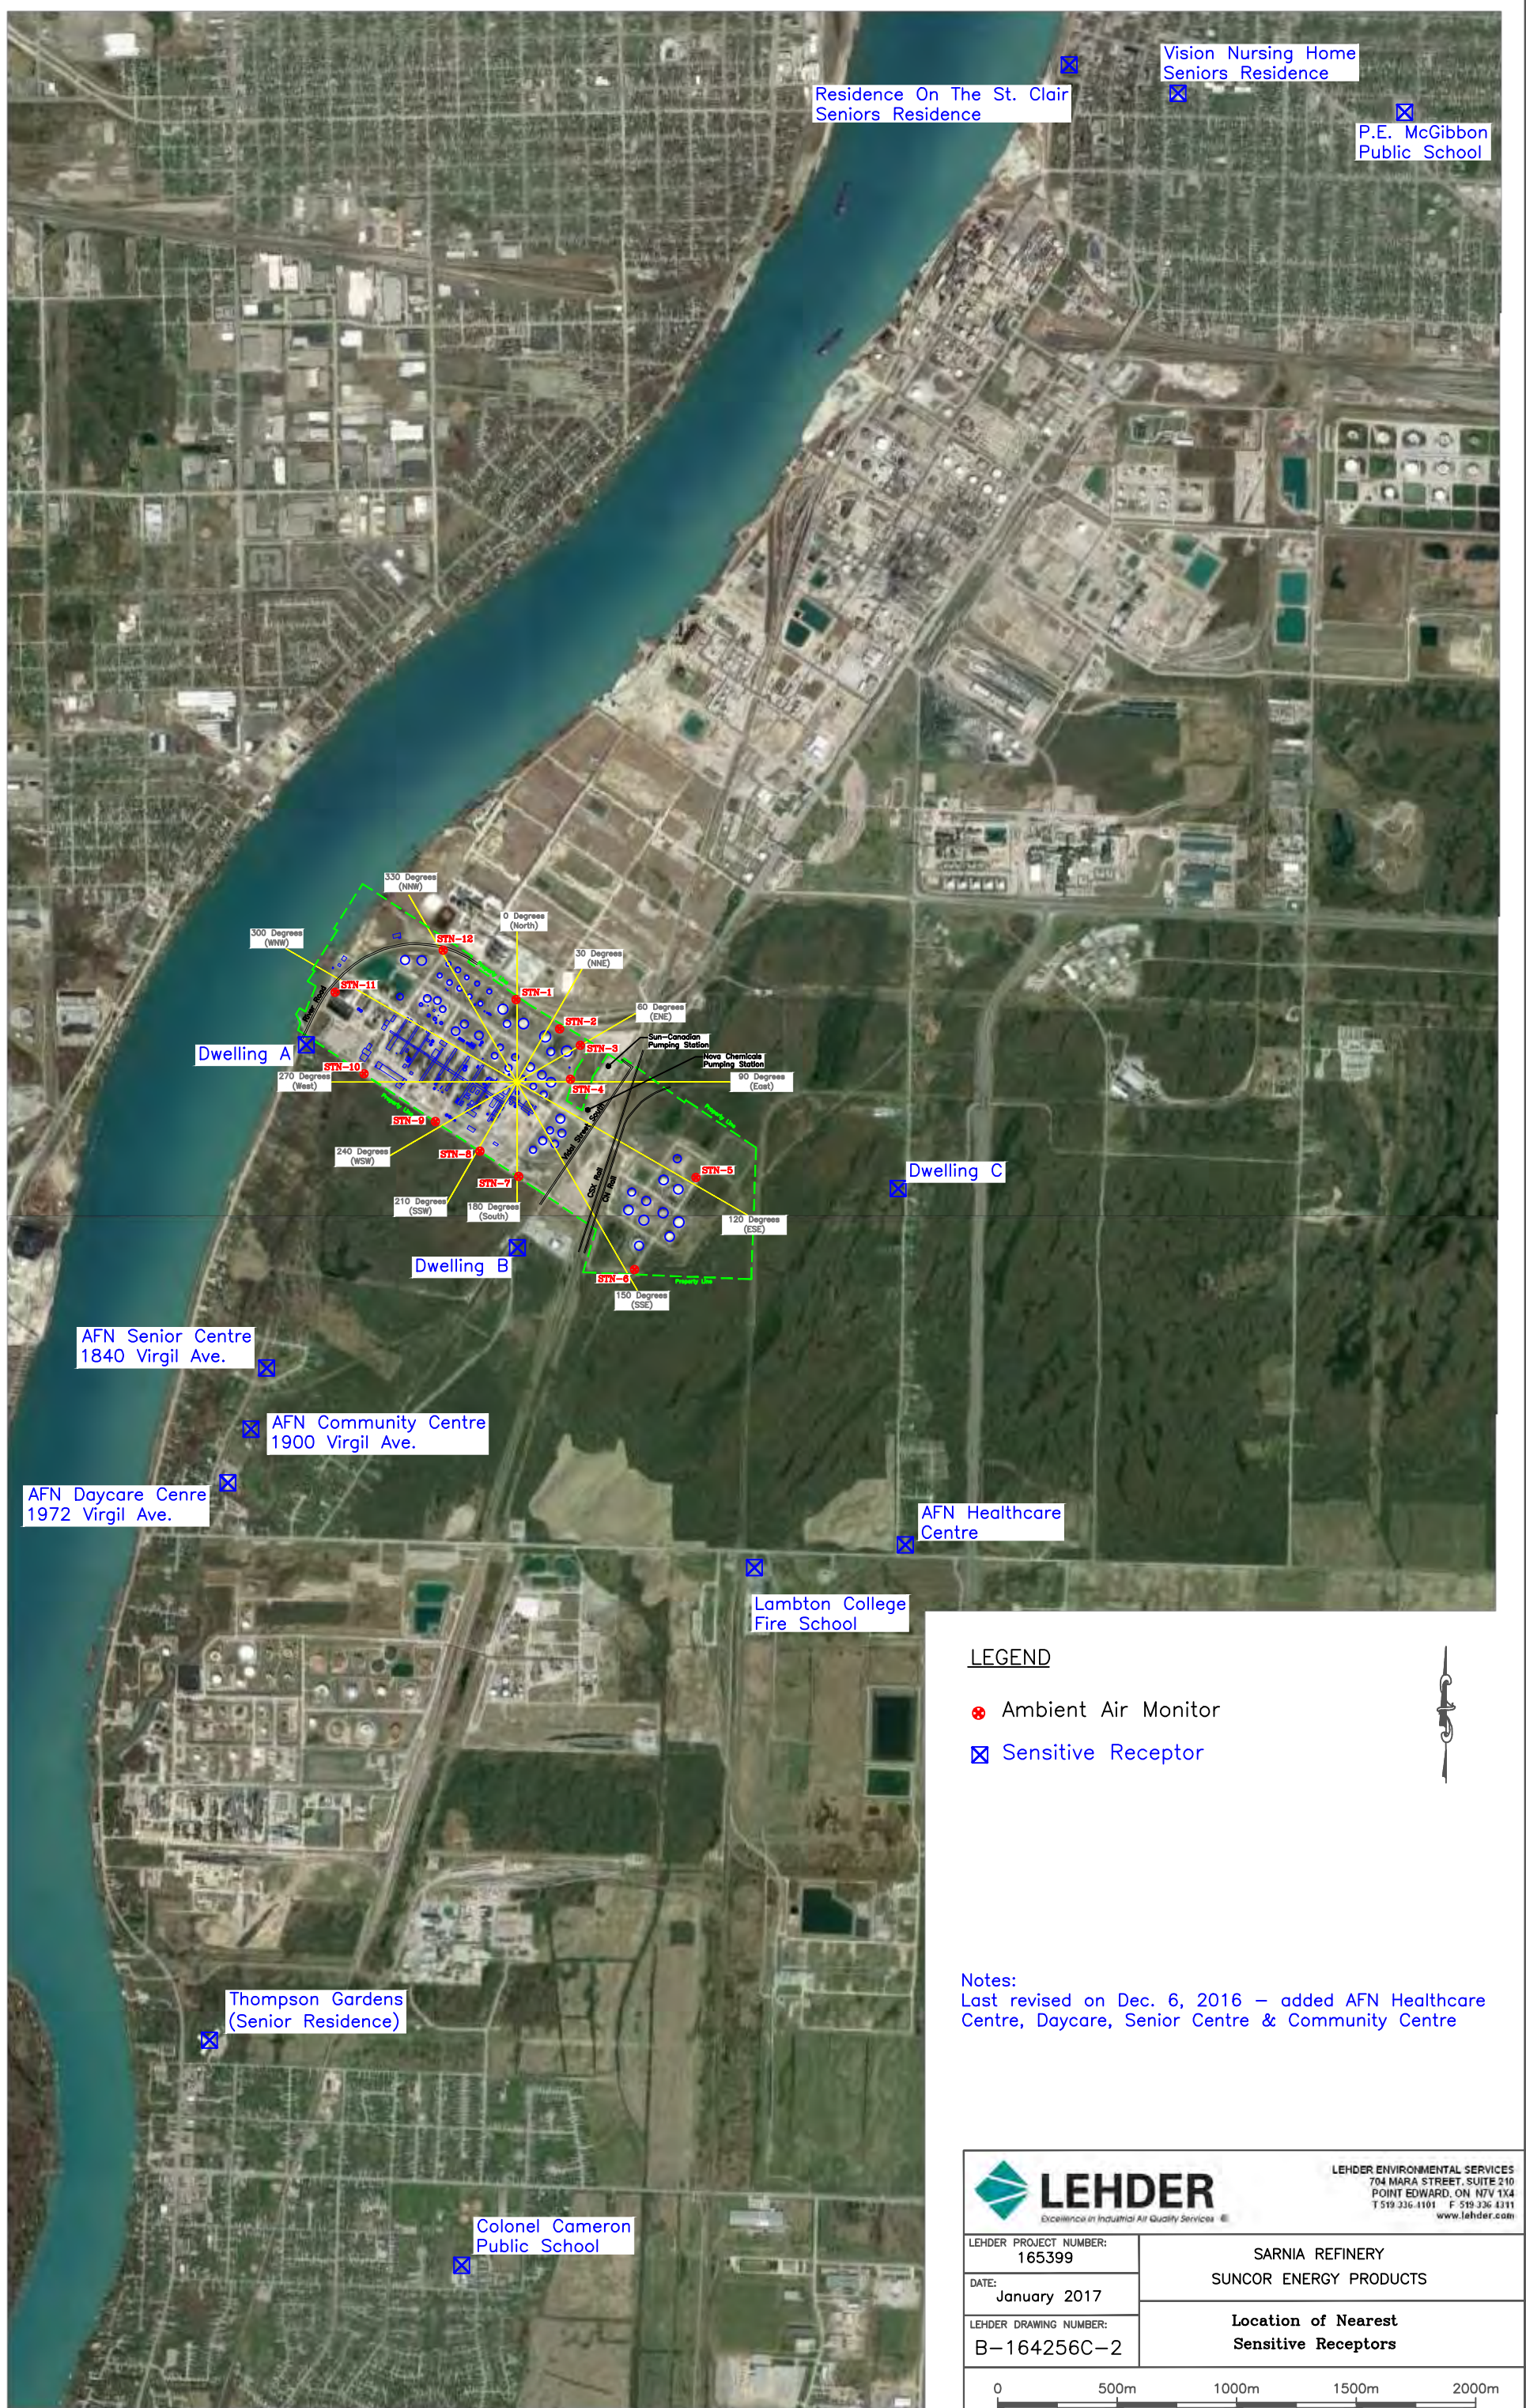

Annual Average for each station:

	Annual Average - Benzene (ug/m ³)
STN-1	2.18
STN-2	2.15
STN-3	1.77
STN-4	1.99
STN-5	1.99
STN-6	1.85
STN-7	1.60
STN-8	1.64
STN-9	1.67
STN-10	1.25
STN-11	1.04
STN-12	1.32
